Instalación de la base de datos:

root@ServerMroslev:~# apt install mariadb-client mariadb-server php8.2 php8.2-mysql apache2 libapache2-mod-php8.2

Creación de la base de datos:

```
oot@ServerMroslev:~# mysql -u root -p
Enter password:
Welcome to the MariaDB monitor. Commands end with ; or \g.
Your MariaDB connection id is 31
Server version: 10.11.6-MariaDB-0+deb12u1 Debian 12
Copyright (c) 2000, 2018, Oracle, MariaDB Corporation Ab and others.
Type 'help;' or '\h' for help. Type '\c' to clear the current input statement.
MariaDB [(none)]> create database wordpress;
Query OK, 1 row affected (0,000 sec)
MariaDB [(none)]> use wordpress;
Database changed
MariaDB [wordpress]> create user 'user'@'localhost';
Query OK, 0 rows affected (0,006 sec)
MariaDB [wordpress]> grant all privileges on wordpress.* to 'user'@'localhost' identified by 'password';
Query OK, 0 rows affected (0,007 sec)
MariaDB [wordpress]> flush privileges;
Query OK, 0 rows affected (0,000 sec)
```

Damos permisos al usuario de apache:

root@ServerMroslev:/etc/apache2/sites-available# chown -R www-data:www-data /var/www/html

Instalo la pagina web de wordpress:

```
oot@ServerMroslev:"# cd /var/www
oot@ServerMroslev:/var/www# wget https://wordpress.org/latest.zip
+2025-01-19 20:57:47-- https://wordpress.org/latest.zip
esolviendo wordpress.org (wordpress.org)... 198.143.164.252
pnectando con wordpress.org (wordpress.org)[198.143.164.252]:443... conectado.
etición HTTP enviada, esperando respuesta... 200 OK
ongitud: 28585184 (27M) [application/zip]
habando a: «latest.zip»
025-01-19 20:57:51 (7,55 MB/s) - «latest.zip» guardado [28585184/28585184
```

Unzipeo el archivo descargado:

oot@ServerMroslev:/var/www#_unzip latest.zip

Copio el sitio de configuración por defecto de apache para wordpress:

root@ServerMroslev:/etc/apache2/sites-available# cp 000-default.conf wordpress.conf

```
🎁 ServerMroslev [Corriendo] - Oracle VirtualBox
Archivo Máquina Ver Entrada Dispositivos Ayuda
:VirtualHost *:80>
       # The ServerName directive sets the request scheme, hostname and port that
       # the server uses to identify itself. This is used when creating
       # redirection URLs. In the context of virtual hosts, the ServerName
# specifies what hostname must appear in the request's Host: header to
       # value is not decisive as it is used as a last resort host regardless.
       #ServerName www.example.com
       ServerAdmin webmaster@localhost
       ServerName www.wordpre.wordpre
       DocumentRoot /var/www/html/wordpress
       # Available loglevels: trace8, ..., trace1, debug, info, notice, warn,
       # error, crit, alert, emerg.
       # It is also possible to configure the loglevel for particular
       #LogLevel info ssl:warn
       ErrorLog ${APACHE_LOG_DIR}/error.log
       CustomLog ${APACHE_LOG_DIR}/access.log combined
       # For most configuration files from conf-available/, which are
       # include a line for only one particular virtual host. For example the
       # following line enables the CGI configuration for this host only
       # after it has been globally disabled with "a2disconf".
       #Include conf-available/serve-cgi-bin.conf
/VirtualHost>
```

Realizamos un a2ensite al archivo de configuración de wordpress:

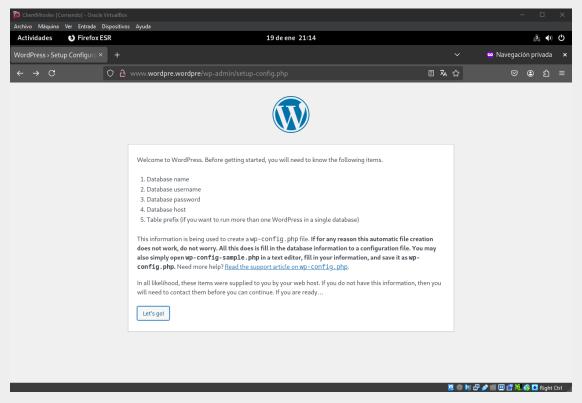

```
root@ServerMroslev:/etc/apache2/sites-available# a2ensite wordpress.conf
Enabling site wordpress.
To activate the new configuration, you need to run:
systemctl reload apache2
```

Reiniciamos apache:

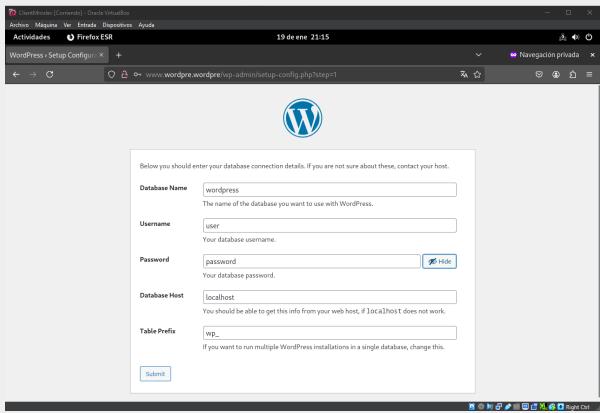

root@ServerMroslev:/etc/apache2/sites-available# systemctl reload apache2|

Visualización de la página web de wordpress desde el cliente:

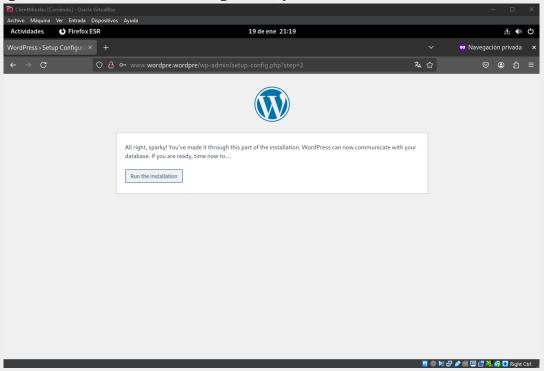

Configuración de la base de datos de wordpress alojada en el servidor:

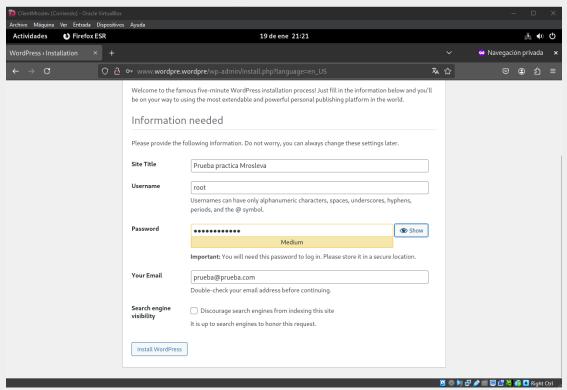

Configuración en el archivo configurada, procedo a instalarlo.

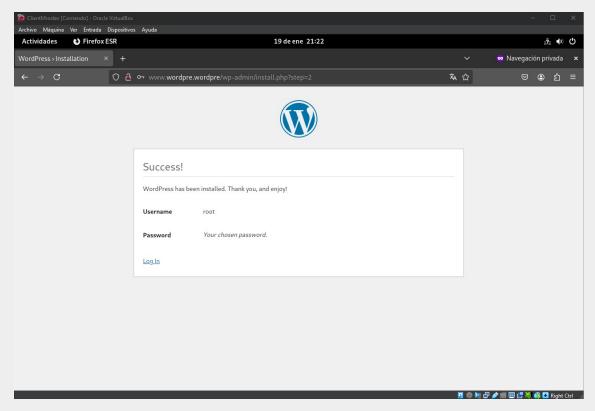

Creamos un sitio de prueba:

Instalación terminada:

Logeo de WordPress realizado:
